

HEALTH BULLETIN

Date: 28/07/2026

This is a brief update about the health condition of Mr. Peddi Sudarsan Reddy aged 54 years Male

Who presented to Outside hospital (Rohini , Warangal) with massive Pulmonary embolism with hemodynamic collapse and shock was revived after multiple rounds of CPR and ACLS measures with approximately 45 minutes downtime. ROSC was obtained , thrombolysis was done in Warangal hospital and shifted here .

Since time of admission, to Advanced Critical Care Unit here and being managed by multidisciplinary care team including Critical Care, Pulmonary, Cardiac, Neurology and other team and allied services. With IV fluids, low dose pressors and other measures. Hemodynamics were well maintained. His respiratory status was managed with lung protective strategies on mechanical ventilator, usual ICU care, prophylactic antibiotics and other measures were followed. Patient respiratory status (on ventilator) vitals were reasonably maintained with minimal supports.

Probably due to duration of downtime patient did not have any meaningful neurological response to verbal or painful stimuli since time of admission even without sedatives. EEG , MRI brain, TCDs showing features suggestive of anoxic damage. As per national /international guidelines neuro status assessment for prognostication combining clinical, Imaging, EEG, flow assessments were followed. A 72 hour reassessment of neuro status is planned tomorrow for better prognostication.

Family were kept updated about condition and prognosis continuously.
